Design Note: CreditNirvana Voice Bot Assignment

Approach

Both bots are voice-first prompts: short turns (about 25 words), spoken-form numbers, Hinglish that mirrors the customer's language, and explicit interruption handling. Each prompt has the same skeleton: role, one measurable goal with a fallback ladder, a locked set of case facts, tone, call flow, objection library, negotiation limits, compliance, and end-of-call outcome tags. Locking the facts and the floor inside the prompt stops the model inventing figures mid-call.

Bot 1: Loan Settlement

- Conversion: a three-step ask ladder: full Rs 6,50,000, then Rs 4,00,000 lump sum within 7 days, then a split or token payment to lock the offer. The amount never goes below Rs 4,00,000; only timing and structure flex. The call never ends without a date.
- Excuses: every excuse gets a short acknowledgement, a call-out that it does not change the dues, and a return to "give me a date and an amount". The bot names the repeat pattern directly, which delivers the firm tone requested.
- Pressure without threats: consequences (credit-bureau impact, the lender's right to legal recovery, accruing interest) are stated once as facts, then the bot returns to the offer. Urgency comes from the real 7-day window and the Rs 2,50,000 saving.
- Compliance: 8 AM to 7 PM window, recorded-call disclosure, borrower verification before any detail, no third-party disclosure, no abuse, no invented legal action, grievance route on dispute, and a distress exit.

Bot 2: Car Insurance Renewal

- Conversion: consultative opening, IDV change explained before the customer raises it, discount anchored at Rs 5,000 saved (about Rs 40 a day), then 2 to 3 add-ons matched to discovery answers. Fallbacks: fewer add-ons, base renewal, payment link with a committed time.
- IDV as a pitch: the Rs 1,00,000 drop is explained as depreciation, then used to sell Return to Invoice and Zero Depreciation.
- Price comparison: the bot invites a like-for-like check (same IDV, same add-ons, garage network, claim handling) and never disparages competitors or invents their price.
- Policy questions: comprehensive vs third party, NCB and cashless are answered directly; anything uncertain is sent in writing on WhatsApp instead of guessed.
- Compliance: no false claim guarantees, no invented discounts or prices, add-ons stated as optional, payment only through an official link, never OTP or card details on the call.

Assumptions

Add-on prices were not provided, so the bot does not quote exact prices. Lender and insurer names are placeholders. No tools are connected, so each bot promises the payment link by SMS and WhatsApp rather than sending it.

Testing and what it changed

I generated an automated test suite on Sarvam for each agent (AI-written tough-customer scenarios with expected behaviours) and used the failures to rewrite the prompts.

- Riya, first run: 10 of 25 passed. Core money paths held (full payment, the Rs 4,00,000 floor, job-loss and "already paid" excuses, wrong number, self-harm distress). Failures: multi-step negotiation, a 9 PM call, calming

a "police" threat, leaking loan details to a family member, not stopping collection on hospitalisation or bereavement, long replies, and reading digits aloud.

- Fix: a "hard stops" block that overrides everything (identity before any loan detail, distress ends the pitch, calling hours, explicit "no arrest" reassurance, floor, amounts spoken in words, two short sentences) plus a one-step-per-reply negotiation rule.
- Aman, first run: 11 of 21 passed. Most failures were the prompt naming payment and logging tools that were not connected, and Engine Protect not pitched for city drivers.
- Fix: removed the tool references (the bot now promises the link by SMS and WhatsApp only), and made Zero Depreciation plus Engine Protect the default pitch for city, traffic and rain.
- Voicemail is switched off on the loan bot so a debt message can never be left with a third party. Re-run scores after these fixes were not completed before the free credit ran out, so I am not claiming them.
